SERVICE BRIEF

Infrastructure Support Services

Our services promote the implementation and management of a coordinated and dynamic infrastructure designed to take your company where you want it to go.

Managing Your Critical Infrastructure

Your organization needs an infrastructure that can support it.

At Edit Technology Solutions, our services promote the implementation and management of a coordinated, efficient, and dynamic computing infrastructure that is designed to take your company where you want it to go.

Server Room Design

New technologies have radically changed the modern server room.

In order to protect your central computing infrastructure, you will likely need to make some alterations to the property in which you plan on storing your servers to meet your organization's needs. We have the resources to produce the desired result no matter your needs.

Server Rack Design

Customized solutions to ensure that all of your servers are secure and reliable.

If your organization needs to house several servers, you will need a system to manage your infrastructure. At Edit Technology Solutions, we understand that your rack space can help you coordinate your computing resources, as well as provide a streamlined effect that will provide technicians a valuable sitemap when doing maintenance on those systems.

Battery Backup

Complete battery backup that works to protect your infrastructure.

Events that are beyond your control can be devastating to your computing infrastructure if you aren't prepared for them. A common event, such as a lightning strike, can fry your server, leaving your organization in shambles. To protect crucial hardware, we can provide your organization with Uninterrupted Power Supply devices that protect your crucial hardware from power surges that could result in catastrophe.

Cable Management

Comprehensive cabling and wiring strategies to build a safe and efficient office.

Unfortunately, cables and wires are a must for any business looking to employ a ubiquitous computing infrastructure. The key is to avoid the dreaded mess of cables that could not only cause issues getting around your computing infrastructure, but could create problems when adding and subtracting devices. Our technicians are trained with the best practices to run cables proficiently with long term operations in mind.

Features

- Thoughtful server room design and configuration taking the latest technologies into consideration.
- Streamlined and mapped out server racks to improve maintenance and organization of the server room.
- Backed up and protected by an Uninterrupted Power Supply.
- Mindful and organized Cable Management services for problem mitigation and long-term function.

Benefits

- A more efficient and reliable server infrastructure behind your business operations.
- Improved organization of your business' critical features.
- Protection against power outages, interruptions, and surges.
- Future-focused cable management design and implementation for simplified changes later on.
